$$\dot{x} = x + y$$

$$\dot{y} = 4x + y$$

$$\Rightarrow \begin{bmatrix} \dot{x} \\ \dot{y} \end{bmatrix} = \begin{bmatrix} 1 & 1 \\ 4 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

$$\Rightarrow A = \begin{bmatrix} 1 & 1 \\ 4 & 1 \end{bmatrix}$$

$$\Rightarrow det(A) = -3$$

$$\Rightarrow A - \lambda . I = \begin{bmatrix} 1 - \lambda & 1 \\ 4 & 1 - \lambda \end{bmatrix}$$

$$\Rightarrow det(A - \lambda . I) = \lambda^2 - 2\lambda - 3$$

$$\Rightarrow \qquad = (\lambda - 3)(\lambda + 1)$$

$$\Rightarrow \qquad = 0$$
Hence  $\lambda = r = 3$  and  $\lambda = s = -1$ .
For  $\lambda = r = 3$ 

For 
$$\lambda = r = 3$$
  
 $(A - \lambda . I) \nu^r = \begin{bmatrix} -2 & 1 \\ 4 & -2 \end{bmatrix} \nu^r = 0$   
 $-2\nu_1^r + \nu_2^r = 0$   
 $4\nu_1^r - 2\nu_2^r = 0$   
 $\nu_1^r = 1$   
 $\nu_2^r = 2$ 

$$u^{1} = e^{rt} \begin{bmatrix} 1 \\ 2 \end{bmatrix}$$
and
$$u^{r} = \begin{bmatrix} 1 \end{bmatrix}$$

$$\nu_2^r = 2$$
Hence one solution is
$$u^1 = e^{rt} \begin{bmatrix} 1 \\ 2 \end{bmatrix}$$
and
$$\nu^r = \begin{bmatrix} 1 \\ 2 \end{bmatrix}$$
For  $\lambda = s = -1$ 

$$(A - \lambda . I) \nu^s = \begin{bmatrix} 2 & 1 \\ 4 & 2 \end{bmatrix} \nu^s = 0$$

$$2\nu_1^s + \nu_2^s = 0$$

$$4\nu_2^s + 2\nu_3^s = 0$$

$$4\nu_1^s + \nu_2 = 0$$
$$4\nu_1^s + 2\nu_2^s = 0$$

$$4\nu_1^s + 2\nu_2^s = 0$$

$$\nu_1^s = 1 
\nu_2^s = -2$$

 $u_1^s = 1$   $u_2^s = -2$ Hence, a second solution is

$$u^{2} = e^{st} \begin{bmatrix} 1 \\ -2 \end{bmatrix}$$
and
$$v^{s} = \begin{bmatrix} 1 \\ -2 \end{bmatrix}$$

and 
$$v^s = \begin{bmatrix} 1 \\ -2 \end{bmatrix}$$

In phase diagram,

Unstable arm of the saddle is the line through the eigen vector  $\nu^r$  Stable arm of the saddle is the line through the eigen vector  $\nu^s$
